

The data type which cannot be changed after creation

Values may be deleted

It is only readable

Ex:- $a = 25$
 $b = 'H, I'$

Variables can hold values of different data types

Numeric Data Type

In python it represents the data having a numeric value -

A numeric value can be an integer, a floating number or even or even a complex numbers.

These values are defined as python int, python float and python complex classes in python programming

Example:-

Integer :- It is represented by int class, it contains positive or negative whole numbers without fractions or decimal. In python there is no limit to how long.

Example:- $a = 123$

Float

It is represented by the float class.
It is a real number with a floating point,
it is specified by a decimal point.

Example:- $b = 1.24$
