

list in python can be created by just placing the sequence inside the sequence bracket

Example :-  $a = [1, 2, 3]$

## Tuple

It is input like a list.  
A ~~list~~ tuple is also an ordered collection of python objects.

It is represented by a tuple class.  
The creation of a python tuple without the use of parenthesis is known as tuple packing.

## Boolean

It is the python data type with one of two built in values is true or false.  
Boolean objects that are equal to true are truthy and those equal to false are falsey.  
It is denoted by the class bool.  
True and false with 'T' and 'F' are valid booleans. Otherwise python will throw an error.

Ex :-

## Set Data Type :-

In python a set is a unordered collection of data types which is iterable, mutable and has no duplicate elements.
