

exactly how many times we want to execute the loop

while loop → If it is used to repeatedly execute a block of code as long as certain condition are true this loop when we don't know how many time we need to execute this loop.

Transfer Statement

Transfer control from one main program to another depending the source program. it alters the

→ If it alters the way the logic gets executed

Break → The break statement are used inside the loops to break the loop execution based on some condition. Continue statement are used to skip

Continue → This statements are used to skip the current iteration & continue to next

Pass → In programming if block is required which won't do anything then we can define that keyword with pass keyword. This statement does nothing. It is used to define a empty block of code or a class. It is last statement in loops & blocks.
