

Troposphere :

Altitude extends from the Earth's surface to 8 km in polar region. Layer of atmosphere where life and weather exists.

Temp^r decreases with the increase of altitude to minimum (-50°C to -60°C)

Long wave radiation that comes from Earth is absorbed by this layer to maintain heat energy. It contains life saving elements N_2 , O_2 , CO_2 and H_2O particles.

Top of the troposphere layer is known as tropopause and its temp^r is 17°C . In this layer aeroplanes commercial aviation takes place.

Stratosphere

It ranges from (16 to 50) km. With the increase of altitude temp^r increases from (-60°C to 0°C) have outer limits.
