

The upper layer of stratosphere is known as stratopause.

It contains ~~o~~ Ozone (O_3) that forms ozone layer.

Mesosphere :

50 to 80 km altitude

Temp[°] decreases slowly with altitude from (0° to -75°) C

upper layer of mesosphere is known as mesopause

The lowest temp[°] in entire atmosphere is found ~~at~~ at mesosphere

Most of the meteoroid burn in this sphere despite of lowest energy due to high friction.

Thermosphere :

It extended from (80 to 500) km altitude and temp[°] increases above 80 km.

In this layer the basis of chemical composition as well as physical properties are identified other than temperature.
