

The float datatypes represent floating point numbers. A floating point number contains decimal points. This value is represented by float class.

floating point numbers can also be written in scientific notation where we use e or E to represent the power of 10 .

2.5×10^4 can be written as $2.5e4$ or $2.5E4$

$$\left. \begin{array}{l} \text{num} = 25.566 \\ b = 2.5E4 \end{array} \right\}$$

here 'num' and 'b' are float variables

Complex type

The complex number is a number that is written in the form of $(a + bJ)$ or $(a + ib)$ $a = \text{real}$ and $b = \text{imaginary}$

$$i = \sqrt{-1}$$

The parts 'a' and 'b' may contain integers or float
