

It is defined as Reduce instruction Set Computer

It depends on software to Optimise the instruction set.

It requires multiple registers to store the data.

It has simple decoding algorithm.

Uses of pipe-line are simple

It uses the limited No. of instruction that requires less time to execute the instruction.

It uses LOAD and STORE instruction which are independent and Operated in register to register interaction

It has more transistors in memory register.

The execution time is less.

It can be used in high end applications like image and video processing.

It has fixed instruction format.

Eg :- ARM (Not in use Now), AVR (Automatic Voice recognize), ARC (Advance risk Computing Computer)
