

- It is defined as Complex instruction Set Computer.
- It depends on hardware to optimise the instruction Set.
- It requires single register to store the data.
- It has complex decoding algorithm.
- Uses of pipe-line is difficult.
- It uses the large No. of instruction that requires more time to execute the instruction.
- It uses LOAD and STORE instruction from Memory to memory interaction.
- It has less transistors in memory register.
- The execution time is quite higher.
- It can be used in low end application like Home Automation, Security System etc.
- It has Variable instruction format.
- Eg :- AMD, INTEL X86, Motorola 680
