

Instruction Set Architecture :

It is defined as the design of the Computer from the programmer point of View.

It is not Conserved with the implementation of Specific details of Computer.

It is Conserved with the set (or) collection of basic operations Computer must support.

There are three objective use for an ISA.

ay It define the type of operation instruction to be Supported by processor.

* Based on the type of operation they are classified into 3 types :

i) Arithmetic or logical instruction : —

This instruction perform Various arithmetic or logical instruction when One or more operand.

ii) Data transfer instruction : —

This are responsible for the transformation of instruction from the memory to processor registers and Vice-Versa.

iii) Branch and JUMP instruction : —

This are responsible for badaking the sequential flow of instruction and jumping the instruction to other level (Location).
