

RAM (Random Access memory): —

It is a type of Volatile memory that can be read and written to.

It is used as temporary storage for data and programs when the Computer is running.

It is further divided into 2 types:

Static RAM (S-RAM): —

It uses flip-flops to store each bit of data.

It is faster and more expensive than D-RAM.

Dynamic RAM (D-RAM): —

It uses Capacitors to store each bit of data.

It is slower and less expensive than S-RAM.

ROM (Read-Only memory): —

It is a type of Non-Volatile memory that can be only read and it is used to store the programs that are not modified.

It is divided into different types.

MASK ROM: —

It is a type of ROM that is programmed during the manufacturing process.

Once programmed the content of ROM can't be changed.

PROM: —

It is a type of ROM that can be programmed once by the user.

EEPROM: —

It can be programmed and erased electrically.

It is used to store the data that needs to be modified

Occasionally such as BIOS setting of motherboard.
