

Characteristics : —

Capacity : —

It is the global volume of information that memory can store. As we move from top to bottom in the hierarchy a 'Capacity' increases.

Access Time : —

It is the time interval b/w the read or write request and availability of data. As we move from top to bottom in the hierarchy it increases.

Performance : —

When a computer system was designed earlier without a memory hierarchy design the gap in speed increased b/w the given CPU register and the main memory due to large difference in system access time.

Cost per bit : —

It increases as we move from bottom to top in the hierarchy i.e., external memory is cheaper than internal memory.
