

- () → function, tuples & expression
- { } → sets & dictionaries
- [] → list & indexing
- :
- separate variable or element in a list triple etc.
- # → to begin a comment

Datatypes in Python

1. Numeric datatype
2. Sequence datatype (string, list, tuple)
3. Boolean datatype
4. Mapping datatype (set, dictionary)

1. Numeric type

i Integer datatype

- This is represented by class 'int'
- Inactive all whole numbers
- Very small int to very large int can be represented as int.

Ex:

```
a = 10
print(type(a))
// <class 'int'>
```

ii) Floating point / Real datatype

- This is represented by class float.
- These are fractional value containing a decimal point. All floating point value
