

are represented in the memory as double type.

Bu:- $a = 7.5$

```
Print (type(a))  
{class 'Float'}
```

Complex datatype:-

It represents complex number of the form $a + bi$

$a = \text{real part}$ } are represented
 $b = \text{imaginary part}$ } as float

Bu:- $c = 3.5 + 7.0j$

```
Print ("Real part = ", c.real)
```

```
Print ("Imaginary part = ", c.imag)
```

```
Print (type(c))
```

```
o/p {class 'complex'}
```

Sequence datatypes:-

1) String:- It represents sequence of characters within a pair of single double or triple quotes.

- All string values are represented by class 'str'.
