

`Print(S.find("ss")) # 2`

`capitalize()`: To make 1st alphabet of a string to capital letters.

`title()`: To convert a sentence into title case.

`split()`: It is used to split a sentence into a list of words.

Ex:-

`S = "Python is a programming language"`

`Print(S.split())` # ["Python", "is", "a", "programming", "language"]

`split(split string):`

`S = "There is a fine weather today"`
`print(S.split("he"))`

Partition: It is used to divide a string

- (i) The string left to the partition string
- (ii) The partition string itself
- (iii) The string to the right of partition string.

→ It returns the result as a tuple

`S = "abcd efghijklm"`

`Print(S.partition("xyz"))` # ("abcd ef", "xyz", "ghijklm")

`S = "abcd efghijklm"`
