

It is a group of lines that acts as a connecting codes for several devices are all the functional unit.

The bus can be only used for one transfer at a time i.e. only two units can actively use the bus at a given time slot.

The single bus is cost effective (low cost) and it is very flexible for attaching the peripheral devices. Bus structures are basically 3 types;

Data bus : —

This bus allows to travel back from the CPU to the memory and vice-versa.
