

Start the rmi registry service by the rmi registry tool.

javac *.java
start rmi registry

Create and start the remote application

Create and start the client program.

Architecture of RMI application

An RMI application, you write 2 applications

1. A server program
2. A client program

→ Inside the server program a remote object is created and reference of that object is made available for the ^{client} rmi registry

→ The client program requests the remote object its method.

The following diagram shows the architecture of RMI application.
