

Goals of RMI

To minimize the complexity of the application.

To preserve type safety.

Distributed garbage collection.

Minimize the difference between working with local and remote object.

RMI Communication flow

Client calls method on stub.

Stub forwards call to remote JVM using RMI protocol.

Skeleton receives call and passes to the actual object.

Return result goes back to the same code.

`Rebind()` → This is a static method of the `java.rmi.Naming` class, it registers (saves) the remote
