

or any database language.

→ Java application provides for the developer to ~~write~~ use MySQL statements and process the result in a consistent, database independent manner.

Need of JDBC

JDBC provides rich, object oriented access to database by defining classes and interfaces that represent such as follows:-

1. Database connection.
2. MySQL Statement
3. Result set
4. Database metadata
5. Prepared statement
6. Callable statement
7. Database drivers
8. Driver Manager

Models of Database

There are two models:-
