

Callable Statement → for executing stored procedures in the database.

Statement and Prepared Statement can only run normal SQL queries but when we want to call stored procedures (business logic stored in database) Callable Statement must be used.

business logic → rules, calculation and conditions that define how application is used.

In this case mysql supports three commands IN, OUT and INOUT.

IN - sends data from java to DB.

OUT - return value from the data base.

INOUT - Both ways.
