

Life cycle of a Servlet

↳ A Servlet life cycle defines the process through which a Servlet instance is created, initialized, serves client requests, and is finally destroyed by the web container. The life cycle of a Servlet is managed by the Servlet Container.

Phases of Servlet life Cycle:-

Loading and Instantiation or creation

↳ When the Servlets is first requested the Servlet container loads the Servlet class into memory and creates an instance of it.

Initialization (init() method)

↳ After the Servlet instance is created, the container calls the init() method only once. This method is used to initialize resources like database connections, files, etc.

Request Handling (service() method)

↳ Each time a client sends a request the container calls the service() method. This method handles the
