

request and response. For HTTP servlets, the `HttpServletRequest` method automatically calls `doGet()`, `doPost()`, etc based on the request type.

Destroy (destroy() method)

↳ When the servlet is no longer needed, the container calls the `destroy()` method. This method is used to release resources such as database connections or memory allocation.

Unloading

After the `destroy()` method is called, the servlet instance is removed from the memory by the garbage collector.

Servlet life cycle flow:—

Servlet class is loaded

Servlet instance is created

`init()` method is called

`service()` method is called for each request.

`destroy()` method is called before unloading.

Example:-
