

Introduction to JSP

Java Server pages is a server-side technology used to create dynamic, platform-independent web pages.

It enables developers to embed java code directly into HTML pages using special JSP tags.

JSP is built on top of the Java Servlet API, and each JSP page is internally converted into a servlet by the web container before execution.

Key Features of JSP:-

- ↳ Simplifies the creation of dynamic web pages.
- ↳ Simplifies embedding Java code within HTML using JSP tags.
- ↳ Supports embedding Java code within HTML using JSP tags.
- ↳ Allows code reusability through tag libraries and custom tags.
- ↳ Provides built-in object for easier request handling and response generation.
- ↳ Automatically managed by the JSP engine (no need for explicit servlet coding).
