

5. The response (HTML output) is sent back to the client browser.

This process occurs automatically during the first request, and subsequent requests use the already compiled servlet. Improving performance.

Significance of JSP engine

The JSP engine (also known as JSP container) is responsible for managing the life cycle of JSP pages. It translates, compiles, and executes JSP files as servlets. The JSP engine is typically part of a web server like Apache Tomcat or Jetty.

Key functions of JSP engine:—

- ↳ Translates JSP files into servlet source code.
- ↳ Compiles the servlet into byte-code.
- ↳ Manages execution and memory allocation.
- ↳ Handles page initialization and destruction automatically.
- ↳ Manages the built-in objects and life cycle methods.
