

life cycle of a JSP defines the process from its creation to its destruction by the web container.

Phases of JSP Life Cycle

Translation Phase

→ In this phase, the JSP file is translated into a Java Servlet by the JSP engine. The web container converts JSP syntax into Servlet code (a Java class extending `HttpJspBase`).

Compilation Phase

The generated Servlet (.java file) is compiled into a .class file (bytecode). If there are syntax or compilation errors they are reported at this stage.

Initialization Phase

→ The web container calls the `jspInit()` method once when the JSP is first loaded into memory. This method is used to perform one-time initialization tasks such as setting up database connection or loading configuration data.
