

Note: Once the request is forwarded, the rest of the current Top page is not executed.

<jsp:include> Action Tag

The <jsp:include> tag is used to include the content of another resource at request time. It allows dynamic inclusion of files such as header, footer or navigation menus.

Syntax:

```
<jsp:include page = "relativeURL" />
```

Example:-

```
<jsp:include page = "header.jsp" />
```

Difference from include directive: The include directive (<%@include %>) is static inclusion (during translation time), while the action tag is dynamic inclusion (during request time).

<jsp:param> Action
