

Describe about Database Protocol Driver & describe the methods to navigate Resultset.

Explain with an example how Resultset is used with Prepared Statement.

Differentiate b/w executeQuery method and executeUpdate method.

Database

Introduction to Distributed Application Development

Distributed application development refers to the process of designing and building heterogeneous systems where components are distributed across ~~access~~ multiple networked networked computers but work together as a single system.

Features of Distributed Application:-
Resource Sharing:- Allow multiple systems to share data, file, printer and other resources.

Scalability:- The system can easily scale horizontally by adding more nodes.
